Exail Robotics Belgium Company Presentation

EXAIL is an international company that has become an industrial champion in the field of high-tech solutions for the civil and defense sectors. Its headquarters are located in France.

The Belgian division - EXAIL Robotics Belgium - develops and produces surface and underwater "drones" that detect, identify and destroy mines in a maritime context. Thanks to our innovative "standoff" concept, which will be used by our customers such as the Belgian and Dutch navies, we can significantly increase the efficiency and reduce the risks associated with mines clearance.

In R&D, we also develop our own sonars. Sonars use acoustic waves to scan their surroundings (similarly to radars, but with sound instead of electromagnetic signals) which enable our customers to view and detect objects on the waterbed.

Two sites are present in Belgium; The R&D center is located in our offices in Mouscron, and is in charge of the conception, design and development of our products. The facilities in Ostend host the production chain of the company, assembling and testing all vehicles and equipment we sell.

EXAIL is playing an important role in pushing forward the boundaries of traditional mine warfare by offering a unique stand-off approach, enabling navies to safeguard crews and ships by keeping them away from the minefield.

Would you like to help assemble, test and deliver our drones to make our seas safer? Do you want to join a young team full of enthusiasm for her job.

Apply for one of our vacancies and join our team!
